I having some difficulties with a server running cvs.
When I run the cvs server from inside xinetd, with the following config:

```
service cvspserver
{
    disable        = no
    socket_type    = stream
    wait         = no
    user         = root
    log_type       = FILE /var/log/cvspserver
    protocol      = tcp
    env          = HOME=/var/cvsroot
    log_on_failure  += USERID
    port         = 2401
    server        = /usr/bin/cvs
    server_args    = -f --allow-root=/var/cvsroot pserver
}
```

and netstat -a shows the cvspserver port listening.

When I run it from the command line:
cvs -f --allow-root=/cvsrepos pserver
it shows the following message in the logs:

cvs: error setting KEEPALIVE: Socket operation on non-socket

and netstat -a doesn't show the port.

(It doesn't matter whether I have the CVSROOT variable set or not.)
Has anyone seen this before?

Thanks, John.
p.s.
kernel 2.6.24 - ovz005
Gentoo root & vz env.
cvs version: 1.12.12-r5 (also tried r2 and r4)
