Hi,

I solved this adding manually a secondary ip, with vzctl in master:

```
vzctl set {CTID} --ipadd {n.n.n.n} --save
```

Once made, in WHM, i recalculate ip-pool and I can now work with this ip fully, working 100%.

For any reason, if I add the ip with cPanel doesn't assign correctly the ip (in network restart unmade network changes), maybe is a cPanel bug over OpenVZ. Or maybe a problem related to hypervm.

Hope this help, thanks.

Regards,  
Amil
