Fixed, my bad.

I didn't understand the use of the dist files, and when I created a new template, I called it lenny.tar.gz. This meant, because of filename matches, vzctl didn't know that this was a debian distro, and was defaulting to treating it like a redhat one.

So, it was trying to set the IP address with the wrong command, and failing.

Correct naming of template, as described at http://wiki.openvz.org/Configuring_container_creation
