---

Hi,

I don't know how to describe it properly however when I for example try an apt-get update from a container it starts hitting some of the repositories however at some point it just starts hanging at "Waiting for headers". All of the containers have real ips which are routed to my box. Is a problem like that known? Iptables accepts for testing purposes all connections and allows all traffic.

My kernel version:

Linux scs001 2.6.24-6-fza-amd64 #1 SMP Mon May 12 19:35:09 UTC 2008 x86\_64 GNU/Linux

Thanks for help.

Edit: I forgot some information. I'm using the venet network module and all my iptables are completely empty. My first guess would be that some of the pakets are only getting routed to the host node and not any further.
