- First of all, make sure that you've configured eth0 interface inside VE properly http://wiki.openvz.org/Veth#Simple_configuration_with_virtua I_Ethernet_device
- Then check your routing records inside VE. (make sure that network packets don't leave your VE from venet0 interface.)
- Use topdump utility to find out:
- * do the packets leave your VE propely
- * do they reach HN
- * do they leave HN
- * does the external node respond
- * does the response reach veth interface on the HN

interface on the HN and eth* interface on the HN)

* does the response reach eth* interface inside VE (try to ping something and at the same moment run tcpdump on eth* interface inside VE, veth*

http://wiki.openvz.org/VLAN

Make sure that firewall in the HN/VE allow your VE to communicate with external nodes.
