I'm posting topdump (its the same on HN as in VE):

11:35:59.979932 IP 10.0.0.3 > 10.0.0.1: ICMP echo request, id 23060, seg 179, length 64

11:36:00.979954 arp who-has 10.0.0.1 tell 10.0.0.3

11:36:00.979959 arp reply 10.0.0.1 is-at 00:18:51:3a:d4:5d

11:36:00.979984 IP 10.0.0.3 > 10.0.0.1: ICMP echo request, id 23060, seg 180, length 64

etc. There is no echo reply.

If I configure devices without vlan in VE I can ping HE and VE each other, I suspect that I could ping also remote interface, but there is no vlan so I cant. Its all about those vlans.

Maybe a step-by-step howto for one interface, multiple vlans?
