Thank you for your help,

the problem "ask your host for a list of IPs you can use" means that I need more public ip, can use my public ip from the both NIC.

Or, I need to add a private ip to each CT, but in this case I will have to redirect all trafic to CT via NAT, because otherwise how can reach my CT from external: apache

I wanted something simple:
HN: use only the port ssh to manage CT
CT101: used as panel: using public ip from NIC, accessible from internet and can communicate with other CT
CT102 and other: have privates ip and are used for services

Thx
