I'm looking for something really similar to this

My plan is to have some partitioning on the VZ:

/ (symfs, the vz private folder)

/usr/local/apache

/var

/tmp (noexec,nosuid)

/home (quotas)

It's really simple to do this by editing the fstab on the node and I think that it would be done from within a vps, but I've read that it's not possible to mount a partition inside a vps as ext3 because it only works on ext2 partitions.

Is it possible to do this kind of partitioning with bind (mounting on vz root) and that it works ok with all the quota and such ?
