Hello,

First off, I'd like to say that we are impressed by OpenVZ. We've tried other server virtualization software but we like VZ the best. We are having issues with network, however. Any suggestions you can provide would be greatly appreciated.

Our problem is that we will want to have many partitions that attach to several different VLANS.

For example,

a bridge called br0, that bridges a VLAN interface and a tap device or dummy device.

We have found that exporting tap devices to the VPS fails and that exporting dummy devices is useless because either a) the bridge communication is lost and/or b) there is no arp.

What is the recommended method of configuring OpenVZ to use bridged interfaces?

Derrick
