you shouldn't have aliases on the HN!
If you want to assign an ip address to your VE "vzctl set $VEID --ipadd x.x.x.x" is sufficient.

That's exactly what I did.
As per the wiki, I did:
[host-node]# vzctl create CTID --ostemplate osname
[host-node]# vzctl set CTID --ipadd a.b.c.d --save
[host-node]# vzctl set CTID --nameserver a.b.c.d --save
[host-node]# vzctl start CTID

Basically the only things I've done with this server is to install the kernel & tools, reboot into OpenVZ kernel, download the CentOS 4 prebuilt OS template, then create the containers using the above commands.

I then tried to connect to them via SSH and that worked fine, but outgoing connections from the containers isn't working.

I did also make some config changes to grub etc as per the instructions on http://wiki.openvz.org/Quick_installation but other than this I haven't installed or changed anything else on the server from a fresh RHEL4 install.
