2.6 kernel is pretty good backward compatible with 2.4. You can safely run Redhat7.3 on OpenVZ, the only thing you should care about is NX bit support. If your processor supports NX bit, then you will need to add 'noexec=off' to kernel commandline (and reboot). You can simply add this parameter by default if don't know whether CPU supports it or not (cat /proc/cpuinfo, line "flags: ... nx... ").
