Hi,

trief to install openvz on a debian system with no success:

```
---  
vzctl --verbose start 101  
Unable to open /usr/lib/vzctl/modules/: No such file or directory  
Starting VPS ...  
Mounting root: /vz/root/101 /vz/private/101  
VPS is mounted  
VPS start failed  
Running: /usr/sbin/vzquota stat 101 -f  
VPS is unmounted  
---
```

I search all logfiles, but I cannot find something. This must be a bug (at least that vzctl is not telling WHAT went wrong)

the host is debian 3.1 and the VPS is debian-3.1-i386-minimal.tar.gz

```
uname -a  
Linux debian-paralles 2.6.16-026test012 #3 PREEMPT Fri May 26 08:51:46 CEST 2006 i686  
GNU/Linux
```

I attached a couple of txt files that may help.

```
strace1.txt is strace -f  
strace2.txt is strace -ff
```

Note: I run debian unter parallels on a intel-mac

The kernel is as minimalistic as possible.

```
--  
lsmod  
Module                Size Used by  
vznetdev              16032 1  
vzmon                 41536 1 vznetdev  
simfs                 4956 0  
vzdquota              41620 0 [permanent]  
vzdev                 3972 3 vznetdev,vzmon,vzdquota  
af_packet             22664 2  
--
```

--
small question: why vzctl is mounting (the already mounted) /vz/private/101 to /vz/root/101 ? what does this simfs do ? it is just for hiding the original fs? so in this case it is optional, can it be disabled ?
--

/sebastian
