---

I am migrating a lot of Ubuntu VE from Vserver to OpenVZ. I could solve all problems except one: the machines wont shut down. A vzctl VEID stop kills all daemons except the init process - after 2 Minutes it seemes the init will recieve a kill -9. A reboot inside the VE in not successful, init hangs forever.

In this forum I found, that it is likely that this behavior has to do with udev. Does someone know the difference to the templates, wich work fine? What changes do I have to make to shut down clean the init process of the VE?

Thx
