The exported filesystem on netapp is - /vol/vol0/studies.
There is single filesystem under /vol/vol0 while /vol/vol0/studies
has just it's own qtree.

On VE the root filessystem is under /vz/private/VEID as usual
and serveral nfs3 mounts where /home/studies/ is:
df /home/studies/
Filesystem   1K-blocks   Used Available Use% Mounted on
netapp3:/vol/vol0/studies
                  671088640 357937592 313151048 54% /home/studies
So /home is local VE filesystem.
 To remind you - the problem appeared simultaneously on all VEs(on same HN) that mount
netapp3:/vol/vol0/studies, and only for this mountpoint. I did not find any clue for problems in HN.
After I rebooted the HN the problem dissapeared, but i'm affraid it my aprear again on any of my
HN.

 Thanks
