Hi There,

It looks like you already have VE with the same id # on the destination node.

If you run something like this:

"vzmigrate --ssh=-p2488 91.xxx.91.xxx 160:960"

note the :960

i added to the end. This should rename the VEID to 960 on the destination node (this is arbitrary number that I chose you can select any id you wish). The other way to solve this would be to simply terminate the VEID 160 on the destination node.

I haven't tested the above, but it should work per this posting:
