Quote:If so why do you expect HN to communicate to your VE via eth3 ip address? Why do you need this possibility?

I do not expect the node to directly communicate with eth3, I'd like to configure the VE as a gateway. Some information will run from other VE to the subnet on eth3, e.g. DHCP through a relay (bad example, since that actually works). Furthermore, OpenVPN will establish a virtual subnet, say 172.16.128.0, through that IF. So the node shall route that traffic to the VE running OpenVPN. As I understand using venet for that communication will not work.
