Hello,

the main problem is to achieve hardware from inside the VE.
Why don't you start additional X server inside VE0 (or inside external machine) and X applications (or complete X environment) inside VE?

Could you possibly describe what has been done?
What kind of capabilities did you grant to VE, what kind of devices you had to create? What kind of xorg configuration file do you use?

Do you think that /proc/bus/pci/02/00.0 would be sufficient? Could you please show the output while X server is starting inside VE?
