Now I again have big problem. The server was hanging after web benchmarking. There is nothing in logs after reseting.
The uptime before was about 1 month.
Now I have a way to install new kernel realeased on 19 May (the day of hanging by the way).
I have 3 questions:
1. Is OpenVZ kernel for SUSE10 stable enough or it's beta?
2. Is OpenVZ kernel for Fedora more stable than for SUSE10?
3. What is to do for kernel troubleshooting? I've read all Guides - there are nothing useful for me.
