Hi,
I've a script to gather the containers net usage, currently using the following:
vzctl exec CID cat /proc/net/dev

The problem
If the container is reaching it's privvmpages, kmemsize, etc, I won't be able to retreive the data, if
the container is restarted in the meantime I won't be able to account the bandwidth usage.

Solution
If was able to access to it (container's /proc/net/dev) from the HN I would be able to gather the
data even if the CID is out of resources
