I am using Kubuntu 8.04 with a linux 2.6.24-23-generic kernel. I have tried to install OpenVZ using apt-get install linux-openvz. I have the following error message:

```
sudo apt-get install linux-openvz
```

```
Reading package lists... Done
```

```
Building dependency tree
```

```
Reading state information... Done
```

```
Some packages could not be installed. This may mean that you have  
requested an impossible situation or if you are using the unstable  
distribution that some required packages have not yet been created  
or been moved out of Incoming.
```

Since you only requested a single operation it is extremely likely that the package is simply not installable and a bug report against that package should be filed.

The following information may help to resolve the situation:

The following packages have unmet dependencies.

```
linux-openvz: Depends: linux-image-openvz (= 2.6.24.16.18) but 2.6.24.23.25 is to be installed  
E: Broken packages
```

Any idea what I'm doing wrong?
