I see.

In that case, you'd want a reverse proxy that can do something like this:

http://www.apsis.ch/pound/

Unfortunately that does mean you'll have to manually maintain the mappings (which host is on which VPS), though I suppose you could write a script to scan each VPS' httpd.conf and related files for virtualhost entries and update the proxy server's config file accordingly. I believe the commercial implementation of OpenVZ (Virtuozzo) can do it all automagically.
