Hello,

unfortunately we cannot affirm for now that oops or crash happened since there are no messages pointing to it.

Probably the user settings caused such behavior.

But if you are still sure that kernel is suspected and we lost some messages because of the netconsole you could install serial console instead

http://wiki.openvz.org/Remote_console_setup#Serial_console

Quote:

System responds to ping but all web-sites are down.

logs and dmesg do not contain anything useful.

Where do web-sites locate? On the HN or inside CT?

Do CTs respond to ping or they lost network connectivity?

Please make sure that failcounters don't increase in /proc/user_beancounters.

Maybe it's worth using tcpdump to obtain packets behavior when somebody tries to connect to your web-server?
