Subject: Consuption of a single virtual machine
Posted by anto_gc on Tue, 03 Feb 2009 08:26:02 GMT

hello all,

How can be known the consumption of CPU of a single virtual machine?

I need to know the CPU consuption of any machine from the EV 0. IS possible?

The CPU consuption with respect the EV 0.

Thanks

--------------EDIT---------------------------------------
If I make
     vzctl exec 111 top b -n 1 | grep 'Cpu(s)'

I obtain the cpu usage into de VPS 111, this usage corresponds at the global CPU usage??? I have made some tests and it seems yes that...approximately

other way is making: head -n 1 /proc/stat

I obtain valus for CPU usage...these values corresponds to a global CPU ?? I say...these values sais me the cpu usage of the virtual machine in the main machine???

thanks
