Subject: hardware performance question
Posted by digidax on Thu, 05 Feb 2009 17:37:48 GMT

Hi,

what strategy would be the better one?

1st: /vz (all VE's) are mounted by iSCSI from a strorage cluster
2nd: /vz (all VE's) are located on the local RAID-1 system and only data paths e.g. /ftp_root oder /mysql_files/*.MDI ... inside the VE are mounted by iSCSI from the storage cluster.

I feel a worse performance still using configuration 1 above on access to ftp oder mysql instead of a clen physical machine.

Andy better solutions?

best regards
Frank
