---

I just have a freshly installed CentOS server, Setup with OpenVZ

I manage to get the VM's up and running fine but they cannot be accessed via ssh nor are able to ping to the outside world!

I have done iptables --flush which i thought would fix the problem but didn't. And i'm not completely sure what else to do. I have a feeling it's a route/forwarding problem.

Any help would be much appreciated, Thank you

Bhavic
