That information was taken from my VM. I don't see this as being a HyperVM problem. HyperVM simply configures the VM in this case. It doesn't actually control the VM to the point of saying "You will have a HD of X size today." At least thats my interpretation of how it works. This is my first go

with OpenVZ and HyperVM, so I am at a loss as to where the issue may lie. I have checked the documentation for both packages and haven't been able to find anything related to this particular issue. Your help is greatly appreciated.
