Hello community,

i have taken a small iptables script i've found years ago on a site called <http://harry.homelinux.org> and tweaked it over the years to fit my needs and adopted recently so it will secure an openvz HN with containers that have international ip-addresses.

i've written it in two parts, the init-script and an config file. it's quite specific to what type of ip filtering i need, but maybe someone out there could use it too?

as i couldn't do much testing yet there are for sure bugs and incompatibilities in there, but i thought maybe some of you would like to give it a try.

it should be relatively easy to adopt the script to your enviroment and maybe i will write a version where more options can be configured via the config file.

i will at least test and improve the script a bit and write a version that will work on containers as well (actually it should already, but there are table-rules that are not wanted inside a container).

if it's somewhat stable it maybe a thing for the iptables article in the openvz-wiki?!

looking forward to suggestions...
Joe
