I am a little new so bear with me.

I recently set up a Centos 5 server, and have ran through installing openvz, I am to the part of installing the vztmpl and am unable to proced.

I entered:

yum -y vztmpl-centos-4-2.0-2

I was then given a bunch of switch options.

Are there new templates for install and where, do I need to download to the centos server or can I pull them in with the above command?

Thanks,
