Subject: CPU-Limit not working?

Hey you guys!

I'm absolutely enthusiastic! OpenVZ is working fine and it's much better than Linux-Vserver as far as I'm concerned.

There is a last question: Do I need special Kernel-Modules to setup CPU-Limits?

I set up a limit of 10% for a container and compiled something in the guest. The total CPU-Usage (top on host) was > 90%.

Does anybody have an idea or a link?

Thank!

Max
