Comparing the Ubuntu 8.04 template I made with the official one, that does boot, I see that I don't have an inittab. Is it possible that I am using an older version of OpenVZ or vzctl that doesn't support the non-init compatible boot process in recent Ubuntu?

These are the versions I am using:

vzctl-3.0.18-1

ovzkernel-enterprise-2.6.9-023stab044.4

vzquota-3.0.9-1

vzctl-lib-3.0.18-1

vzdump-1.0-2
