Subject: Troubles during the installation of openvz
Posted by Balbuzard on Mon, 16 Mar 2009 00:47:31 GMT

Hi!

I would like to install openvz on my computer, and I am having some troubles during the installation.

I have a debian-etch version of linux on my i-686 computer;

I have followed the instructions there http://wiki.openvz.org/Installation_on_Debian

The depots located at deb http://DEBIAN-MIRROR/debian/ testing main
deb http://DEBIAN-MIRROR/debian-security/ testing/updates main
 are unreachable, is there any other web sites to get the same content?

the instruction apt-get dist-install returns E: Invalid operation dist-install so I can not upgrade to lenny (but is it a problem?)

I have chosen the version fzakernel-2.6.18-686 at the next step

I can not install vztcl! But no problem with vzquota.
What can I do to fix this problem?
the shell returns Since you only requested a single operation it is extremely likely that the package is not installable and a bug report against that package should be filled
The package have unmet dependencies : vzctl : dependencies iproute but it is not installable
E: brocken package

To finish with, here are the returns at the steps confirm proper installation:

uname -r returns 2.6.18-14-fza-686
pa ax | grep vz returns 4359 tty1 S+ 0:00 grepvz

about ifconfig, nothing has changed compared to before the installation.

can anyone help me with these troubles?

Thank you very much!!
