I would like to try OpenVZ. I have a Fedora 10 distro (x86-64), with Xen installed. So I would install OpenVZ, leaving Xen and Fedora 10 original kernel.

I think it is possible to create a new entry on menu.lst which I can select to boot openvz or other operating system.

Is it possible?

My current kernel is 2.6.27.5-117-fc10-x86_64.

Thank you
