Subject: Solution for vzdump with NFS mounts inside CT

Hello,

I'm running inside a CT an Apache webserver. The documentroot is mounted with NFS from a storage, so vzdump doesn't work.

If I would write a simple shell script what's first stop the CT an then vzdump the CT and finally start it, would this be a solution? With the downtime of the http service I wouldn't have a problem.

best regards

Frank
