If I am understanding you right, you have the same IP for multiple containers??

Each container must have its own IP. You can have private IPs for the containers with a NAT setup. In this case you will need to change the port number for the asterisk extension and then in the phone itself. You will also have to set up the port forwarding for the NAT using iptables. See this page for NAT setup:
 http://wiki.openvz.org/Using_NAT_for_container_with_private_ IPs
