You need to setup an INBOUND Route. You will setup SIP to check for the DID that is in the request and forward that call to the correct extension, trunk or to another system as needed.

I currently support a few 100 people on one box. I am using a VE that syncs this to two different machines that I can move the VE to the second box if needed.

I am growing faster than a single asterisk box can handle so now I am doing SER that will handle all of the SIP reg and communicaitons and let Asterisk be the media servers. So I setup the same VE and let the SER pass the calls to the defined group of asterisk boxes for that inbound call or outbound call.
