mmm

you were right. Was no a problem with OpenVZ kernel but a Virtuozzo VZ kernel. Excuse me

Let me ask to you a question relationship with this. In OpenVZ I had some little issues with TCP performance related with conntrack. I solved that editing sysctl.conf and increasing ip_conntrack_max value and applying changes. OpenVZ kernel was 32 bits operating system. So the issue was resolved on Hardware Node level.

It is possible that a problem of conntrack will be only a VE level? And maybe it is related with the issue well-known of "low memory"?

Sorry but, I never understand good this problem.

Thanks!
