Hi all.

I checked the openVZ.org that the latest version for rebuild a kernel in linux is 2.6.24 and the patch file is not for 2.6.24.y. It means I can not build a openvz kernel in linux with version 2.6.24.7. However, for my experiments,I have to use click modular in kernel mode with version 2.6.24.7 that is the only version it has in 2.6.24.y without 2.6.24. I tried to firstly rebuild a openvz kernel with linux version 2.6.24 and then modified the files mentioned in Click patch file and compiled the kernel. Unfortunately, I can not use Click in the new kernel. As a result, I wonder whether there is a good way to solve this problem. If there is, please let me know it. Thanks a lot.
