
Subject: Disabling all limits

Hello,

I'm migrating from Linux VServer to OpenVZ. With VServer I did not setup any limits, so the hardware was shared among all virtual servers in a "first come, first serve" manner.

Now I sometimes get the error:

-bash: fork: Cannot allocate memory

I think it's because of the resource limit.

Is there a way to switch off all limits for all containers so that they behave the same as with VServer?

I would only do this temporarily in order to get the servers quickly up'n'running and would restore and adapt the limits afterwards...

I just do not want to have errors in my migration process which are just caused by limits (I have enough troubles with the migration)

Thank you,
divB
