Quote:
So venet is just one device on the VE0 which may contain multiple L3 IP networks?

venet0 on the HN doesn't contain any ip address.

Quote:
And the system routes the packets automatically to the appropriate interface on VE0?

After "--netif_add" command is invoked an additional route appears on the HN which points to venet0 interface.

Quote:
So venet works only if the VE0 is in the same subnet as the VEs

No.

Another useful tips I guess
