When I try to do:
mount -n --bind /var/lib/vz/shared/var_run_mysqld /var/lib/vz/root/101/var/run/mysqld

You have to do it after VE is mounted.
The best approach is using $VEID.mount scripts.

Quote:
Even though the mount is present and working on the host, the files in the container do not reflect it at all.

I don't understand what you mean?

Quote:
Using a mount point like this also seems to cause problems with vzquota.

What problems you have in mind?
