
Subject: X-Server inside Container?

Hello, I have read and followed the different steps proposed in the tutorial

http://wiki.openvz.org/X_inside_VE

I have configured without problem the X-Forwarding.

I would like to know if there is a way to provide X-server inside the containers, I mean, without having to connect to the X-server located in the host system.

I have tried to install kde Desktop in a container, but the udev module throws errors and the installation can not be completed.

Is there any way to get a Graphic-Desktop in each Containers? And provide it by a command like 'startx'?

Thanks a lot for your help! Don't hesitate to ask me if something is not clear.
