Subject: Enough space, but reports 'no space left on device'

I thought that this is a CentOS 4.7 issue and posted at (
http://www.centos.org/modules/newbb/viewtopic.php?topic_id=1 9958&forum=27). But CentOS
states that it is a OVZ vzquota issue.

I am completely blocked to execute with the error message recurring each time without
completely. I also restarted the vz service, but in vain.

I could not even run yum or use wget to get the default CentOS kernel to test whether it is
associated with OVZ or CentOS!

Any pointer?
