Hi,  
I would like to provide the Graphic hardware into a VPS; I have seen that is may be dangerous (introduce security issues or damage the structure).  
But I have seen that other solutions of virtualisation like VServer let as example the installation of Graphic Server inside a container.  
So, first, which kind of issues can I encounter if I try to install a graphic server inside a container?  
Why the installation of X-Server inside containers may be such harmful for the structure?

Then, OpenVZ lets its containers connect to the Internet, and so lets them to have a connection to the network hardware. I would like to use a driver (OpenGL) located on the HN (I am trying with solutions like X forwarding, or ssh -X but it does not work) Is there a way to establish a connection to the driver, the same way a connection is made to the network card to provide the Internet inside the VPE?

I know it may seem a little confused, so don't hesitate to ask for clarification if it is not clear enough;  
Thanks for you help!
