Hi,

JimL wrote on Wed, 08 April 2009 09:19 I installed the Intrepid x86 template and it went well. I need to have the latest avr compiler and so I upgraded to jaunty. It went fine, however when the ve boots, it hangs. Here's what's running at the time

```
ps -ef
UID      PID  PPID  C  STIME TTY      TIME CMD
root      1    0  0  05:08 ?        00:00:00 init [2]
daemon   180    1  0  05:08 ?        00:00:00 /sbin/portmap
root     237    1  0  05:08 ?        00:00:00 /bin/sh /etc/init.d/rc 2
syslog   263    1  0  05:08 ?        00:00:00 /sbin/syslogd -u syslog
root     265   237  0  05:08 ?        00:00:00 /bin/sh /etc/rc2.d/S11klogd start
root     273    1  0  05:08 ?        00:00:00 /bin/dd bs 1 if /proc/kmsg of /var/run/klogd/kmsg
klog     274   265  0  05:08 ?        00:00:00 /sbin/klogd -P /var/run/klogd/kmsg
klog     275   274  0  05:08 ?        00:00:00 [klogd] <defunct>
root     276    0  0  05:09 ?        00:00:00 vzctl: pts/0
root     277   276  0  05:09 pts/0    00:00:00 -bash
root     291   277  0  05:09 pts/0    00:00:00 ps -ef
```

Any one have a clue as to what's happening? It eventually gets past this but then hangs at The initial stall is because of klogd. You can disable this by running:
vzctl exec \$VEID update-rc.d -f remove klogd
vzctl restart \$VEID

Temporarily, you can also kill the dd and klogd processes.

JimL wrote on Wed, 08 April 2009 09:19 It never brings up the network.

This part I haven't figured out, though, and am currently in the process of trying to figure out how to get a Jaunty VE running. Like with you, I was fine until Intrepid, but upgrading to Jaunty prevents the network from running.
