Hi,

I have created a minimal template cache from Slackware 10.2.

You can download it from <http://homaly.dunanet.hu/wvz/slackware/>
It's just 27 megs.

For the OpenVZ dev guys:

Because the current hosting site has limited bandwidth, I would be grateful if you could serve this file from openvz.org (<http://openvz.org/download/template/cache/> i guess).

Creating it was easy, I just copied a running host's root directory into a private area then followed kir's howto on debian template cache creation.
