I was able to rebuild the lfarkas.org kmod-kvm-85 SRPM package on CentOS 5.3 under the ovzkernel-2.6.18-92.1.18.el5.028stab060.8.x86_64.

KVM kernel module seems to coexist with openvz just fine. Haven't tried without rebuilding, though.

2.6.18-92.1.18.el5.028stab060.8.x86_64

kmod-kvm 85

kvm 85

libvirt 0.6.3

virt-manager 0.7.0

qemu 0.9.1

I'm doing further tests now...

Anyone has a similar setup and can comment on stability and other possible issues?
