Hello,

I have this newly created CT that's having a hard time staying up for longer than 20 minutes. Sometimes it stays up for a few hours but no more. I upgraded the binaries and recycled the HW node but nothing helped.

I have another CT on this same node that's running just fine! When I'm entered into the bad CT, I get booted off of it after a while and receive the error on the console: "got signal 9" and sometimes I get "got signal 15". Then the VE crashes. I have to vzctl start 140 to get it back up and running. Here's what the vzlist looks like after a crash:

```
140 - mounted x.x.x.x server.host.tld
```

I don't know what else to do. The CT has stock cPanel installed with plenty of resources (failcnt is always 0 for all). I also scanned all crontab entries for foul play. But nothing so I'm stuck and I need your help. I'll be glad to provide any info you need.

I'm thinking of converting this container to a Xen VM and hope the crash will go away but I'd rather don't do it if there's a fix.

Thank you

```
# uname -a
```

```
Linux my_hostname 2.6.18-92.1.18.el5.028stab060.2PAE #1 SMP Tue Jan 13 12:31:30 MSK  
2009 i686 i686 i386 GNU/Linux
```

```
# vzctl --version
```

```
vzctl version 3.0.23
```

```
# cat /etc/redhat-release
```

```
CentOS release 5.3 (Final)
```
