Subject: ERROR while getting interface flags: No such device
Posted by Balbuzard on Fri, 15 May 2009 02:45:13 GMT

Hi,

I have successfully configured a private network for my VPS;
On the host machine, I have created a virtal interface venet0.

I would like to create a second private network in the same host machine (some of the VPS will be on the first one, the other on the second one)

I try to create the interface venet1 the same way I have ever created venet0 in the /etc/network/interfaces, but this error occurs when I restart the networking (/etc/init.d/networking restart)

venet1: ERROR while getting interface flages: No such device
Failed to bring up venet1

Is there any way to create an other virtual network for my VPS?

Thank you very much for your help!
