can u tell me how to solve this?

I am having 4 * 150 GB hard disk.

Before installing openvz , i just created a partion for 200 GB with label /vz for openvz

I want to know how the hard disk will be allocated. I thought it will take continous like 50GB from 1st hard disk(since i allocated root and boot total to 100GB) and remaining from second hardisk..

If this is the case , i Dont want to be like that..

I want 50 GB from each hard disk , assume i will create 4 containers..

Is there any way to do like this...
