Wow, you're using PLD linux distribution!

As I understand you've compiled openVZ kernel from sources and the system in question is running this kernel.

Then there must be files "config.h" and "autoconf.h" in  
/lib/modules/`uname -r`/source/include/linux/  
`uname -r` - is actually your running kernel version.

You can try to link them with /usr/include/linux/config.h and /usr/include/linux/autoconf.h. Don't forget to save original config.h and autoconf.h.
